Meteopress

We spot storms before they spot you

Company

Overview

Meteopress (Meteopress spol. s.r.o.) is a Prague-based weather technology company founded in 1992. They build C-band solid state weather radars and AI-driven meteorological software, operating 74 radar projects across all continents protecting 262 million people. Their AIREN (AI Radar Enhancing & Nowcasting) product suite uses machine learning for severe weather detection, precipitation quantification, and short-term NWP forecasts. They also run meteopress.cz, a consumer weather platform for Czech and Slovak users. EU-funded projects include a revolutionary C-band solid state radar combined with an AI nowcasting ensembling system.

Classification

Type	Enterprise Vendor

History & Founders

—

Founded in 1992 in Prague as a meteorological services company. Pivoted to radar hardware manufacturing around 2010 and launched their AI nowcasting AIREN platform in 2019.

1992 Meteopress established

2010 Radar project started

2015 Meteosense — largest radar network in Europe (Croatia, Hungary, Austria, ...)

2018 ZAMG/GeoSphere 5-radar project in Austria

2019 AIREN — AI Radar Enhancing & Nowcasting launched

Partners: PRIMET

Risk Assessment

AGI Displacement	LOW	Meteopress builds physical radar hardware and domain-specific meteorological AI software trained on proprietary radar data. Their value proposition is deeply embedded in hardware engineering, certified meteorological data pipelines, and long-term government/aviation contracts. Foundation models cannot replicate C-band solid state radar manufacturing or AIREN's specialized nowcasting models.
Market Risk	LOW	Weather radar infrastructure is critical national and aviation infrastructure with growing demand due to climate change. 74 global projects, deployments on every continent, and clients including national meteorological agencies indicate real, established demand. Not a hype-driven market.
Funding Risk	MED	A 30+ year old bootstrapped Czech company with a hardware business model and EU project grants. Stable but likely operates at SME scale with project-based revenue rather than recurring SaaS — creating lumpy cash flow. No known VC backing or disclosed revenue.
Overall	LOW	**Strong hardware moat, specialist AI software tied to proprietary radar data, 30+ years of operational history, and global client base across government/aviation sectors. Climate change tailwinds drive sustained demand for weather radar infrastructure.**
